TO
HIS ROYAL HIGHNESS
LEOPOLD,
PRINCE OF SAXE COBURG.

SIR,

THE zeal which Your Royal Highness has manifested in promoting the cultivation of Science, and the peculiar interest you have been pleased to take in Researches on Natural History, encouraged me to hope that these Sketches relative to Southern Africa, the results of my late Brother's Travels in that region, might not be deemed unworthy of your benign regard.

Availing myself of the gracious permission accorded to me, I have the heartfelt satisfaction of dedicating them to a Prince whose exalted qualities have for ever endeared him to the British Nation.

*I have the honour to be
Your Royal Highness's gratefully devoted
and most humble Servant,*

WILLIAM DANIELL.

*Cleveland-Street, Fitzroy-Square,
August 25, 1820.*

HIS ROYAL HIGHNESS
LEOPOLD
PRINCE OF Saxe-Coburg

SIR,

I am very much obliged to you for the letter which I received from you on the 10th inst. and for the interest you have taken in the subject of the proposed marriage of the Prince of Saxe-Coburg with the Princess Alice, daughter of the late Queen Victoria. I am very glad to hear that you are so much interested in the subject, and I am sure that your views will be of great value to the Government.

I am, Sir, very respectfully,
Your obedient servant,
The Prince of Saxe-Coburg

WILLIAM DAVENPORT

FROM the avidity with which the Public is disposed to receive any information that may tend to increase the scanty knowledge we possess of the interior of Africa, or to elucidate the Natural History of that interesting quarter of the Globe, it is not unreasonable to presume, that the series of Engravings now submitted to its judgement will be found to merit a share of approbation. Their claims to the favourable notice of the Public, the Editor is aware, must rest on more substantial grounds than his affectionate regard for the memory of a Brother, whose early loss he has to deplore: divesting himself, therefore, of every consideration arising from such feelings, he takes the liberty to say that Mr. Samuel Daniell devoted himself early in life to the drawing of objects of Natural History; and, in order to extend the field of his research, he went to the Cape of Good Hope, from whence he accompanied Dr. Somerville on two expeditions into the interior of the country. The contents of his Portfolios evince the assiduity with which he pursued his favourite object, while many competent judges have borne ample testimony to the fidelity of his pencil. He was indefatigable in the pursuit of the various subjects he has delineated; and it was his constant care to see the animals alive, that he might make himself master of their actions and habits. To the knowledge acquired in this way, he added all that could be obtained in the country which produced the animals he has represented, by conversation with the peasants and natives. For the greater number of illustrative notices in this Work (which will doubtless be found highly interesting) the Editor has to express his obligations to Dr. Somerville and Mr. Barrow: and he has merely to add with respect to the Engravings, that he has endeavoured to transfuse into them the spirit of the originals by a process which appeared to him best calculated for the attainment of that object.

HARTBEESTIE

Published by W. Daniell, London, July 16, 1820.

W. Daniell del.

W. Daniell sculp.

H A R T E - B E E S T E .

It is thus described by Mr. Barrow in his *Southern Africa*.—"This is one of the finest animals among the numerous family of the Antelope. The male is about seven feet and a half long and five feet high. The horns branch out of a single trunk, that projects about two inches from the forehead. The mouth, and indeed the whole head, resembles that of the bovine tribe; from whence it has obtained in the *Systema Naturæ* the specific name of *Bubalis*. The flesh is remarkably good, resembles very nearly that of beef, and is carefully salted by the boors."

HART-BREAST

It is thus described by Mr. Hart in his *British Fauna*:—"This is one of the most abundant among the numerous family of the Annelids. The male is about seven feet long and half an inch high. The female is much out of a single female. The prolegs about two inches from the forehead. The mouth, and indeed the whole head, resembles that of the bovine tribe; from whence it has obtained its name. The female is remarkably good, resembling nearly that of beef, and is carefully called by the natives."

ANT-EATER.

A N T - E A T E R .

THE *Myrmecophaga Capensis*, or Ant-eater of the Cape, is very common, and, like the Porcupine, undermines the ground, seldom quitting its subterranean abode except in the night. The thighs of this animal are sometimes salted, and in that state are considered as very good hams. His muscular strength is so great, that it is scarcely possible to drag him out of his hole when wounded.

APPENDIX

The *Myrmecophaga* *gambeli*, or *gambeli* of the Cape, is very common, and, like the *Myrmecophaga*, it inhabits the ground, seldom passing its underground except in the night. The light of the animal is sometimes white, and in that state is considered as very good food. Its nocturnal strength is so great, that it is scarcely possible to drag him out of his hole when wounded.

DUYKER.

Wm. Donald, del.

Wm. Donald, sculp.

DUIKER.

DUIKER or Ducker, so named from the mode of ducking or depressing himself to the ground as he escapes, in order to conceal himself under the bushes. He is thus described by Mr. Barrow.—“The colour of the Duiker is wholly of a dusky-brown; he is about three feet seven inches in length, and two feet eight inches in height: the male has horns straight, black, and nearly parallel, but diverging a little towards the points, four inches long, and annulated close to the base. The female has no horns. The *sinus lachrymalis*, or subocular indent, which most of the Antelopes have, is in this species so conspicuous, that the Dutch say it carries the gall-bladder under the eye.”

DUCKER

DUCKER or DUCKER, so named from the mode of ducking or depressing himself to the ground as he escapes, in order to conceal himself under the bushes. He is thus described by Mr. Harmer. "The colour of the Ducker is wholly of a dusky-brown; he is about three feet seven inches in length, and two feet eight inches in height: the male has horns straight, black, and nearly parallel, but diverging a little towards the points, four inches long, and annulated close to the base. The female has no horns. THE MALE ELAND.

THE *Oreas* of the *Systema Naturæ*, the Indian Antelope of Pennant.—“Of all the Antelopes in Southern Africa,” observes Mr. Barrow, “this species is by far the largest and most awkward. The head, the thick neck, and the dewlap of the male, the body, legs, and hoofs are completely bovine. The horns and tail only indicate its affinity with the Antelope tribe. Its habits, its gait, its size and general appearance are those of the Ox. On account of the ease with which this animal is taken, of the utility of its flesh as food, and of its skin for harness and traces, few of them now remain within the limits of the colony; and in no long space of time the Eland will in all probability be a rare beast in the southern angle of Africa.”

THE MALE ELAND.

The Ox of the Great North, the Indian Antelope of Pennant. — Of all the Antelopes in Southern Africa, observes Mr. Harrow, "this species is by far the largest and most awkward. The head, the thick neck, and the dewlap of the male, the body, legs, and hoofs are completely bovine. The horns and tail only indicate its affinity with the Antelope tribe. Its habits, its gait, its size and general appearance are those of the Ox. On account of the ease with which this animal is taken, of the utility of its flesh as food, and of its skin for harness and trowsers, few of them now remain within the limits of the colony; and in no long space of time the island will be all probability be a rare sight in the southern angle of Africa."

FEMALE ELAND.

Saml Daniell del.

Published by W. Daniell, London, July 15, 1800.

W. Daniell sculp.

FEMALE ELAND.

THE same sexual difference exists between the male and female Eland which is found in all other animals ; and it may be traced in the lighter structure and milder character of the present subject compared with the former. Numbers of herds are occasionally met consisting wholly of females ; and the reason assigned is, that the bull, being much larger, fatter, and of a tougher hide than the female, is always selected from the herd, and hunted down by dogs or killed with the musket. They are subject to a cutaneous disease called the *brandt sickte*, which makes great havoc among the bovine tribe.

FEMALE BLIND.

The same sexual difference exists between the male and female blind which is found in all other animals; and it may be traced in the lighter structure and lighter character of the female subject compared with the former. Numbers of birds are occasionally met consisting wholly of females, and the reason assigned is, that the full, being more fertile, better, and of a longer life than the female, is always selected from the herd, and paired with a male of similar quality. They are subject to a cutaneous disease called the itch, which renders great havoc among the bovine tribe.

FEMALE ELAND.

VARIETY OF THE FEMALE ELAND.

It is to be observed that the Eland herds with that singular animal the Gnoo, and with the Quacha, of which Mr. Barrow has given a very full and exact description. That fact is exemplified in the present sketch, which represents a variety of the female Eland having the horns plain, not twisted, and being of a feebler and more delicate structure than that which forms the subject of a preceding sketch. There is a group of Gnoos in the back-ground, and a herd of them and of Quachas in the distance.

VARIETY OF THE FEMALE BLAND.

It is to be observed that the female birds with that singular animal the Gnu, and with the Quacha, of which Mr. Harrow has given a very full and exact description. That fact is exemplified in the present sketch, which represents a variety of the female Bland, having the horns plain, not twisted, and being of a lighter and more delicate structure than that which forms the subject of a preceding sketch. There is a group of Gnus in the back-ground, and a herd of Quachas in the distance.

SPOTTED HYENA.

The page contains faint, illegible text impressions, likely bleed-through from the reverse side of the document.

THE SPOTTED HYENA.

THE Spotted Hyena, or Wolf, as he is denominated by the Dutch inhabitants, is an animal by no means rare, especially in the more remote and consequently less inhabited parts of the province. His character and habits correspond with what we should infer from his aspect: he is sluggish in his motions, and is said to prefer carrion to fresh-killed food; he nevertheless commits great depredations on flocks and herds. He is never seen by day, but issues from his solitude at night, announcing his approach by a dismal howl. He was known in former times to prowl in the streets of Cape Town, and we have heard him in the village of Graafe Reynet. He is supposed to prefer horse-flesh to any other. His skin is so thick, that the natives assert he has the faculty of turning himself in it. The animal from which this drawing was taken, was caught at a farm on the Sundays River in a trap or wolf-house, a very common appendage to the residence. It consists of a small tower, with a falling door suspended by a rope, of which the other extremity is fastened to the ground within the building, having the entrails of a sheep or goat attached to it; so that, by seizing his prey, the Hyena lets the door fall. This animal was baited by some very powerful dogs for several hours; but they made very little impression, and were at length taken off exhausted by the heat of the day. The Hyena only defended himself from their attacks. He was shot. Though the skin was perforated in many places by the tusks of the dogs, the muscles below were scarcely injured.

THE SPOTTED HYENA

The Spotted Hyena, or Wolf, as he is designated by the Dutch inhabitants, is an animal by no means rare, especially in the more fertile and consequently less inhabited parts of the province. His character and habits correspond with what we should infer from his aspect: he is sluggish in his motions, and is said to prefer to sleep to fresh-killed food; he nevertheless consumes great quantities on those occasions. He is never seen by day, but comes forth at night, accompanying his approach by a singular howl. He was known to have been present in the attack on Cape Town, and we have heard him in the village of Groot-Brakke. He is supposed to prefer horse-flesh to any other. It is said in so thick, that the natives are he has the faculty of turning himself in the air. This animal lives in the vicinity of the river, and is caught at a farm on the Swartkops River in a trap or wolf-house, which is common everywhere in the neighbourhood. It consists of a small tower, with a falling door suspended by a rope, of which the other extremity is attached to the ground within the building, having the ends of a rope or goat attached to it; so that by raising his prey, the hyena lets the door fall. This animal was killed by some boys, and was found to be very little improved; but the boys were only defended by length taken off exhibited by the head of the dog. The hyena was protected in many self from their attacks. He was shot. Though the skin was protected in many places by the tails of the dogs, the animal was not very injured.

CAPE JACKAL.

Sam^l Daniell del^d

Published by W^m Daniell London, July 15, 1820.

W^m Daniell sculp^t

J A C K A L.

THE Jackal inhabits most parts of Africa from Barbary to the Cape of Good Hope. It is very easily tamed, when taken young, and in its habits and manners is so nearly like the Dog, that Naturalists suppose that faithful domestic animal to have originated from the Jackal.

JACKAL

The Jackal is most common in the Cape of Good Hope. It is very easily tamed, when taken young, and in its habits and manners is so nearly like the Dog, that Naturalists suppose that this animal to have originated from the Jackal.

BOSCH - BOK.

Sam. Daniell del.

Published by Wm Daniell London July 25 1810

Wm Daniell sculp.

THE BOSCH-BOK.

THE Bosch-bok, *Antilope sylvatica*, is the only variety of this beautiful tribe of animals which inhabits the forest, and he is of all perhaps the most elegant, from the delicacy of his form, the fineness of his coat, the rich brown colour of his hair, contrasted with the spots and other parts which are white, the shining polish of his twisted horns, and, above all, the brilliant eye of the Gazelle. They are never seen in greater numbers than a pair together. The breast of the Bosch-bok, as of all the Antelopes, is the most delicate part of the flesh.

THE BOSCH-BOK.

The Bosch-bok, *Antelope sylvestris*, is the only variety of this beautiful tribe of animals which inhabits the forest, and he is of all perhaps the most elegant, from the delicacy of his form, the richness of his coat, the rich brown colour of his hair, contrasted with the spots and other parts which are white, the shining polish of his twisted horns, and, above all, the brilliant eye of the creature. They are never seen in greater numbers than a pair together. The bosch-bok of the forest, as of all the *Antelopes*, is the most delicate part of the flesh.

CAPE POLECAT.

Scot. Daniell del.

Published by W. Daniell, London, July 15, 1820.

W. Daniell sculp.

CAPE POLECAT.

It is thus described by Mr. Barrow in his *Southern Africa*.—"One species of the *Viverra* is difficult, if not impossible, to tame. It resembles the *Putorius* or Polecat of America, with this difference only, that the latter has five white parallel lines along the back, and the African species only four, that diverge from the shoulder. When first taken they smell very strongly of musk ; which odour, however, shortly wears off by confinement.

CAPT. POLLOCK.

It is thus described by Mr. Harlow in his *Scientific Journal*. "One species of the genus is difficult, if not impossible, to name. It resembles the *Pollockia* or *Pollockia* of America, with this difference only, that the latter has five white parallel lines along the back, and the African species only four, that diverge from the shoulder. When first taken they smell very strongly of musk; which, however, shortly wears off by confinement."

G E M S - B O K .

Sculp'd by Daniel Defoe

Engraved by W. Daniel London, July 20 1790

W. Daniel sculp't

1830

G E M S - B O K .

“THE Gems-bok is a very beautiful animal, and of a size much larger than the Spring-bok. It has none of that timidity which generally marks the character of the Antelope ; but, on the contrary, if closely pursued or wounded, will coolly sit down on its haunches, and keep both sportsman and dogs at bay. Its long, straight, sharp-pointed horns, used in defence by striking back with the head, make it dangerous to approach. Dogs are very frequently killed by it ; and no peasant, after wounding the animal, will venture within its reach till it be dead, or its strength at least exhausted. The flesh of the Gems-bok is reckoned to be the best venison that Africa produces.”—Barrow’s *Southern Africa*.

GRASSHOPPER

"The Grasshopper is a very beautiful animal, and of a size much larger than the Spring-bok. It has none of that timidity which generally marks the character of the Antelope; but, on the contrary, it closely pursues or wounds, will coolly sit down on its haunches, and keep both eyes open and close at day. These are very frequently killed by it; and no hunter, after wounding the animal, will venture within its reach till it be dead, or its strength be fully exhausted. The flesh of the Grasshopper is reckoned to be the best venison that Africa produces."—Hartley's Travels, &c.

CARACAL.

Saml Daniell del.

Published by W. Daniell, London, July 15, 1850.

W. Daniell sculp.

C A R A C A L.

THE Caracal, from the Turkish *Karrah ku-cale*, or Cat with black ears, inhabits Persia and India as well as Africa. The tips of the ears, as in the Lynx, are distinguished by tufts of black hairs. It may be tamed, and used in the chase of lesser quadrupeds, but is very fierce when provoked. There is a vulgar notion that this animal, as well as the Jackal, is the Lion's provider, because both have been often seen gnawing such carcasses as the Lion is supposed to have fed upon the night before.

CATACTAL

The Caracal, from the Turkish *Karakulak*, or Cat with black ears, inhabits
 Persia and India as well as Africa. The tips of the ears, as in the Lynx, are distin-
 guished by tufts of black hair. It may be tamed, and used in the chase of lesser

ON THE ORANGE RIVER.

Sam. Daniell del.

Published by Wm Daniell London 45 St. Pauls Churchyard

Wm Daniell sculp

VIEW ON THE ORANGE RIVER, OR GAREEP.

THIS view represents the Orange River emerging from one of those deep chasms which open out upon the plain near the sea-coast. This river, like the Nile, has its periodical inundations. When full, it exhibits a very grand object; and in its low state, when the waters are clear, the stream flowing over a pebbled bed, in which are found specimens of opal, cornelian, calcedony, agate, and other uncommon stones, has a beautiful effect. Its banks are the resort of the Hippopotamus and the Rhinoceros: two of the latter animals are introduced in the fore-ground. They are of the species common to Southern Africa, having two horns, of which the upper is a mere stump of about six inches in length. Some writers consider this animal to be the Unicorn, so poetically alluded to in the book of Job: "Canst thou bind the Unicorn with his band in the furrow, or will he harrow the valleys after thee?"

VIEW OF THE ORANGE RIVER, OR GORGE.

There is a view of the Orange River, which is one of the most beautiful
which opens out upon the plain near the town. This river, like the Nile, has its
periodical inundations. When full, it exhibits a very grand aspect; but in its low
state, when the waters are clear, the stream flowing over a bed of
round fragments of coral, conchoidal, calcareous, agate, and other numerous stones,
has a beautiful effect. The banks are the growth of the Hippopotamus and the Rhinoceros.
The latter animals are numerous in the neighbourhood. They are of the
species common to Southern Africa, being two feet of which the upper is a more
stump of about six inches in length. Some writers suppose this animal to be the
I mention an incident which took place in the month of July. I went then to the Union
with his hand in the river, and he was killed.

RAEL.

R A T E L.

BARROW observes, that "the choice food of the Ratel is honey; and Nature has endowed it with a hide so very thick, that the sting of a bee is unable to penetrate through it. No animal is perhaps more tenacious of life than the Ratel. A dog with great difficulty succeeds in worrying him to death; and it is a species of amusement for the farmers to run knives through different parts of the body, without being able for a length of time to deprive it of existence."

NATURAL

Barrow observes, that "the elasticity of the skin is so great, and Nature has endowed it with a hide so very thick, that the sting of a bee is unable to penetrate through it. No animal is perhaps more tenacious of life than the Seal. A dog with great difficulty succeeds in worrying him to death; and it is a species of amusement for the farmers to run knives through different parts of the body, without being able for a length of time to deprive it of existence."

ROCK RABBIT.

THUS described by Mr. Barrow.—“ In the caverns of the Table Mountain, and indeed in almost every mountain of the colony, is found in considerable numbers a small dusky-coloured animal about the size of a Rabbit, with short ears and no tail, called the Das, and described in the *Systema Naturæ* of Linnæus under the name of *Hyrax Capensis*, and by Pennant under that of the Cape Cavy. The flesh is used for the table, but is black, dry, and of an indifferent flavour.”

ROCK RABBIT.

First described by Mr. Barrow. In the eastern of the Table Mountain, and
 indeed in almost every mountain of the colony, is found in considerable numbers a
 small dark-colored animal about the size of a Rabbit, with short ears and no tail,
 called the Rock Rabbit, and described in the *Journal of James Smith* the naturalist
 of the expedition, and by Leonard under the name of *Lepus*. The flesh is used for
 the table, but is black, &c. and of an indifferent flavor.

GONAH HOTTENTOT.

THE traveller who visits those regions which are inhabited by rude and uncultivated nations, may observe many things which, however insignificant in themselves, still derive some degree of importance from the proof they afford of the similarity of the objects and pursuits of man, though varying in their shades and gradations, from the circumstances in which he is placed. Thus, it has been the custom in all nations, savage or polished, for those who had distinguished themselves by their valour in battle, or address in the chase, to display the trophies they had won, or to wear emblems of them ; hence arose orders of merit and armorial bearings. We often find the young men among the natives of Southern Africa recommending themselves to their chiefs and mistresses by wearing tufts of the Lion's mane, the tusks and claws of the Lion or other animals, attached to their hair, tied round the neck, arms, wrists, knees, or ancles ; rings of the Elephant's tusks are very common. The Gonah Hottentot, whose Portrait is represented, had adorned himself with the skin of a Jackal killed by him, fantastically arranged on his head.

HOTTENTOT.

HOTTENTOT.

THE following particulars from Mr. Barrow's description of the Hottentot may be cited in illustration of the present sketch.—“The face is in general extremely ugly ; but it differs materially in different families, particularly in the nose, which in some is remarkably flat, and in others considerably raised. The colour of the eyes is a deep chesnut : they are long and narrow, removed by the broad base of the nose to a great distance from each other. The cheek-bones are high and prominent, and, with the narrow-pointed chin, form nearly a triangle. Their teeth are beautifully white. The colour of the skin is that of a yellowish-brown, or faded leaf ; many are nearly as white as Europeans. The hair is of a very singular nature ; it does not cover the whole surface of the scalp, but grows in small tufts, at certain distances from each other, having, when kept short, the appearance and feel of a hard shoe-brush ; with this difference, that they are curled and twisted into round lumps, about the size of a large pea. When suffered to grow, the hair hangs in the neck in hard twisted tassels, not unlike some kinds of fringe.”

HOTTEST

The following particulars from Mr. Hutton's description of the Hottentot may be cited in illustration of the present sketch. "The face is in general extremely ugly; but it differs materially in different families, particularly in the nose, which in some is remarkably flat, and in others considerably raised. The colour of the eyes is a deep chestnut; they are long and narrow, removed by the broad base of the nose to a great distance from each other. The cheek bones are high and prominent, and, with the narrow-pointed chin, form nearly a triangle. Their teeth are beautifully white. The colour of the skin is that of a yellowish-brown, or faded red; many are nearly as white as Europeans. The hair is of a very singular nature: it does not cover the whole surface of the scalp, but grows in small tufts, at certain distances from each other, having, when kept short, the appearance and feel of a hard black brush; with this difference, that they are curled and twisted into various forms, about the size of a large pen. When suffered to grow, the hair hangs in the neck and is twisted loosely, not unlike some kind of fringe."

FEMALE HOTTENTOT.

It may be remarked, that in all Hottentots the brows are knit as if the individual were frowning ; but, although the features bespeak anger or discontent, such internal feelings are by no means characteristic of that people, who, on the contrary, are cheerful and good-humoured. The ungracious expression arises from no other cause than an effort to exclude as much as possible the offensive rays of the sun, which may best be judged of by those who have attempted to withstand them bare-headed.

It may be remarked, that in all Hotteries the men are first of the individual
men's feelings: but although the feelings of the men are of the individual, and
feelings are by no means characteristic of that people, who, on the contrary, are
characteristic and good-humoured. The opposite expression arises from no other cause
than an effort to exclude as much as possible the offensive rays of the sun, which may
best be judged of by those who have attempted to withstand the sun's heat.

CARRIES.

K A F F E R S.

“ THERE is not, perhaps, any nation,” says Mr. Barrow, “ that can produce so fine a race of men as the Kaffers. They are tall, stout, muscular, well made, elegant figures.” Without investigating the particular causes of their fine forms and athletic strength, he remarks that they are exempt from many of those evils which in more civilized countries contribute to impede and cramp the growth of the body. Their diet is extremely simple ; their exercise of the most salutary kind ; the air they breathe is pure ; they are strangers to intoxicating liquors, and their minds are unaffected by violent or corroding passions. The countenance of the Kaffer is always cheerful, and his whole demeanour bespeaks content and peace of mind.

W. Donnell, sculp.

HOTTENTOT—BOSJESMAN—BOOSHWANA.

IN this sketch are contrasted the three principal tribes which compose the native population of Southern Africa. The characteristics of the Hottentot have already been noticed ; and for an account of the other two subjects recourse may be had to Mr. Barrow's Narrative of his *Voyage to Cochin China*. The Bosjesmans appear to be among the most miserable of the human race ; diminutive in their persons, but well made ; of the colour of a faded leaf ; the joints and prominent parts of the body almost black with a thick coating of hardened dirt ; their face and their clotted hair smeared with red ochre and fat ; their little eyes, scarcely visible, ever in motion, and on the watch.—The Booshwanas are a branch of the Kaffers, and participate in the general character of that tribe. The above-mentioned work of Mr. Barrow contains an interesting description of their domestic life and manners.

CHAPTER I

The first part of the book is devoted to a general survey of the subject. It is divided into three sections: the first dealing with the history of the subject, the second with the principles of the subject, and the third with the application of the subject to practice. The second section is the most important, as it contains the principles which govern the whole subject. The third section is also important, as it shows how the principles can be applied to practice. The first section is less important, as it is only a historical survey.

H E N D R I C K.

A KAFFER youth, belonging to a party who fled from their country, and settled on the Gamka, or Lion River. He was interesting from the frankness of character so well expressed in his countenance, as well as from the remarkable circumstance of having been rescued from a Lion, which had sprung upon him, by the presence of mind of his companions ; the animal had knocked him down with his paw. He bore the marks of the claws having perforated the muscles of the arm, which in consequence remained to a certain degree contracted.

THE HISTORY OF THE

OF THE

OF THE

OF THE

BOOSHWANA—HOTTENTOT.

THIS is another contrast of the Booshwana with the Hottentot, between whom there is as remarkable a difference in physiognomy as in disposition and habits. The Booshwanas seem to have made greater progress in civilization than the other tribes ; and while they derive from agriculture, pasture, and hunting, the mere necessities of life, they are by no means insensible to its conveniences and luxuries.—See Barrow's *Voyage to Cochin China*.

KAFFER.

K A F F E R.

MR. BARROW observes, "The men were the finest figures I ever beheld: they were tall, robust, and muscular; their habits of life had induced a firmness of carriage and an open manly demeanour, which, added to the good-nature which overspread their features, showed them at once to be equally unconscious of fear, suspicion, or treachery. A young man about twenty, of six feet ten inches high, was one of the finest figures perhaps ever created; he was a perfect Hercules, and a cast from his body would not have disgraced the pedestal of that deity in the Farnese palace."

KAFER

Mr. Harnoy observed, "The men were the best figures I ever beheld: they were tall, robust, and muscular; their habits of life had induced a firmness of carriage and an open, manly demeanour, which, added to the good nature which overpowered their features, showed them at once to be equally unassuming of heart, suspicious, or treacherous. A young man about twenty, of six feet ten inches high, was one of the finest figures perhaps ever created; he was a perfect Hercules, and a cast from his body would not have disgraced the pedestal of that deity in the Parthenon."

KAFFER GIRL.

KAFFER GIRL.

THE Kaffer females are thus noticed by Mr. Barrow.—“ Good humour, animation, and a cheerful turn of mind beamed conspicuously in their countenances. They appeared to us to be modest without reserve, extremely curious without being troublesome ; lively but not impudent ; and sportive without the least shadow of lasciviousness. Their personal charms it is true were not of a very captivating nature ; though, getting over the prejudice of colour, which was that of a dark-glossy brown verging on black, several of them might be accounted handsome. The rapid movement of their dark sparkling eyes gave animation to their countenances ; their teeth were beautifully white and regular ; they had neither the thick lips nor the flat noses of the African Negroes, and the whole contour of the face and head was equally well formed with that of Europeans. But the most striking feature in their character was a degree of sprightliness, activity, and vivacity that distinguished them from the women of most nations that are but little advanced in civilization, and who are generally reserved to strangers.

The Kaffer females are thus noticed by Mr. Harvey:—"Good nature, animation, and a cheerful turn of mind begeth conspicuous in their countenances. They appeared to us to be modest without reserve, extremely courteous without being too pliant; lively but not impudent; and positive without the least shadow of haughty manner. Their personal character it is true were not a very captivating nature; though, getting over the prejudice of colour, which was that of a dark glossy brown varying on black, several of them might be accounted handsome. The rapid movement of their dark sparkling eyes gave animation to their countenances; their teeth were beautifully white and regular; they had neither the thick lips nor the flat noses of the African Negroes, and the whole aspect of the face and head was equally well formed with that of Europeans. But the most striking feature in their character was a degree of sprightliness, activity, and vivacity that distinguished them from the women of most nations that are but little removed in civilization, and who are generally reserved to strangers."

THE KOKOON.

Saml. Daniell del.

Published by Wm Daniell, London, July 16, 1820.

Wm Daniell sculp.

K O K O O N.

“A PARTY of the Dutch boors had the good fortune to shoot an animal that was totally unknown to any person in the expedition, and hitherto apparently undescribed by any Naturalist. It was called by the Booshwanas the Kokoon. In its general appearance it bore a resemblance to the Gnool, but was of a much larger size. It measured in height four feet five inches; in length, from the head to the rump, five feet. The head was one foot ten inches long; ears ten inches; tail of long black hair three feet three inches, resembling that of a horse; neck uncommonly thick in proportion to the body. It had a mane, very unlike that of the Gnool, flowing over its shoulders, and continuing to the middle of the back. The forehead, like that of the Buffalo, was covered with an osseous excrescence, being in fact the root of the horns, which were terminated in fine pointed extremities, like those of the Gnool. From the centre of the forehead to the nose was an arched or concave protuberance, covered with a ridge of long black hair; and on each cheek, a little below the eye, was a remarkable spot of a circular form, rather more than an inch in diameter, naked, and apparently glandulous, the surface being made up of bundles of fine vessels, out of the orifices of which oozed a white viscous matter. Close under the glands grew tufts of black hair; a long black beard, like that of the Gnool, covered the throat from the chin to the breast. The nose and mouth were like those of an Ox, but more broad and flat. The general hue of the body was of an ash-coloured grey. It had neither the speed, the activity, nor the spirit of the Gnool. Of this extraordinary animal Mr. Daniell made an accurate drawing.”—Barrow’s *Voyage to Cochin China*.

KOKON

A pair of the Dutch boots had the good fortune to shoot an animal that was
 totally unknown to any person in the expedition, and which is apparently undescribed
 by any Naturalist. It was called by the Boobians the Kokon. In its general
 appearance it bore a resemblance to the Gnu, but was of a much larger size. It
 measured in height four feet six inches; in length, from the head to the tail, five
 feet. The head was one foot ten inches long; ears ten inches; tail of long black
 hair three feet three inches, reaching that of a horse; neck remarkably thick in
 proportion to the body. It had a mane very small, a list of the mane, flowing over
 its shoulders, and continuing to the middle of the back. The head and the list of
 the back, was covered with an obscure reticulated pattern, like that of the Gnu.
 Horns, which were terminated in the pointed extremities, and those of the Gnu.
 From the centre of the forehead to the nose was a small, narrow, and pointed
 covered with a ridge of long black hair; and on each side of the head, there was
 was a remarkable spot of a circular form, and a small, narrow, and pointed
 naked, and apparently glandular. The surface of the head was covered with a
 vessels, and of the outside of which, small, narrow, and pointed, and of the
 glands grew into of black hair; a long, thin, and pointed, and of the
 the throat from the side to the throat. The throat and neck were covered with
 On the nose, head and tail. The general color of the body was a uniform
 grey. It had neither the spots, the stripes, nor the rings of the Gnu. It was
 extraordinary animal. It, I think, made an animal, which is a new
 species.

A BOSJESMAN FEMALE.

A WOMAN of the tribe of Bosjesmans, the lowest of the Hottentot race. Few of them are so well provided with attire and ornament as the individual here represented. The whole property of a female generally consists in an Ostrich egg-shell, a skin, often too scanty to cover half the body, a leathern pouch, bracelets, anklets, and necklace made of thongs of leather, adorned with beads or fragments of Ostrich egg-shell. The Ostrich egg-shell serves the important purpose of containing water when they traverse the arid sandy plains in quest of food or flying from danger.

BOOSH-WANA.

A BOOSHWANA.

A Booshwana, with a hat formed of leaves, resting upon his parasol, probably of the earliest construction, made of Ostrich feathers, tied round a stick.

A BOOSHAWA.

A Boosha, with a lot of small of leaves, growing upon the ground, probably of the earliest description, seeds of which are found in the soil.

T'KANESS.

Sam^l Daniell del^rPublished by W^m Daniell, London, July 15. 1820.W^m Daniell sculp^r

A KORAH GIRL.

T'KANESS, the daughter of T'Goosht Kaba, a wealthy chief of the Korah Hot-tentots, on the north of the Gareep or Orange River. Her skin was as fair as that of an European. She was the most timid of all the natives who were met with on the expedition to the north-east, and every art of persuasion and bribery was necessary to overcome her unwillingness to have her portrait drawn, from the apprehension that the ceremony was connected with some incantation.

A KORAH GIRL

THANAS, the daughter of T. Gobat Kabo, a wealthy chief of the Korah Hot-
 lands, on the north of the Gariep or Orange River. Her skin was as fair as that
 of an European. She was the most timid of all the natives who were met with on
 the expedition to the north-east, and every art of persuasion and bribery was neces-
 sary to overcome her unwillingness to have her portrait drawn, from the apprehension
 that the ceremony was connected with some incantation.
